## BELT RATINGS

HT Belt Drives are a H.O.T. (Helical Offset Tooth) design that will reduce belt drive associated noise up to 30% and greatly reduce belt drive associated vibration. Furthermore, HT Belt Drives have a substantially increased torque capacity over a standard straight tooth belt drive. How do we do it – the continuous rolling engagement belt always has three teeth engaged. Standard belt drives have only one single tooth engagement. This feature eliminates slipping, stretch and a design that can handle balls to the wall power.
